

Further reading

- [Fisher information is generally believed to represent a lower bound on mutual information \(Brunel & Nadal, 1998\), a result that is frequently used in the assessment of neural coding efficiency. However, we demonstrate that the relation between these two quantities is more nuanced than previously thought](#)
- [Fisher information and D_KL](#)

To me, I notice that,

- I_F and I_{mutual} both measure the "information".
- I_F is unsymmetrical and I_{mutual} is symmetrical.
